Corollary

- Let n and k be integers with $0 \leq k \leq n$. Then
$$C(n,k) = C(n,n-k)$$

- **Proof**

From the previous theorem, it follows that

$$C(n,k) = \frac{n!}{k!\,(n-k)!}$$

$$C(n,n-k) = \frac{n!}{(n-k)!\,[n-(n-k)]!} = \frac{n!}{(n-k)!\,k!}$$

Hence, $C(n,k) = C(n,n-k)$.
